# What's New with Comfort-Aire/Century's HE Series?

## Overview

The HE Series is a game-changing new geothermal heat pump that is the first in the industry to integrate digital communicating controls, two-stage capacity, variable-speed fan and variable-flow geothermal source functions within a single compact "plug and play" package. Available at a breakthrough price point, this innovative product line has been specifically designed and developed for price sensitive, and many times space limited, new home construction and replacement/retrofit applications.

The HE Series is a packaged water-to-air system that provides high efficiency heating and cooling and, via an integrated desuperheating package, most of the annual hot water requirement. The eco-friendly series already meets ENERGY STAR® Tier 3 efficiency levels, so it will qualify for the uncapped 30% federal geothermal heat pump tax credit in 2012 and beyond. Systems are available in vertical and horizontal configurations in nominal capacities of 24, 30, 36, 42, 48 and 60 kBtuh.

## Digital 2-Way Communicating Controls – Monitor, Configure and Diagnose Digitally

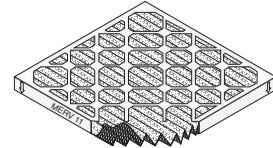

The units also break new ground in optimized comfort, efficiency, and serviceability, utilizing industry first and exclusive Two-Way Communicating Controls as a standard option with every unit. The digital two-way communicating controls make installation and service of the system easy and effective by allowing monitoring, configuration and diagnosis of the system on a Communicating Digital Thermostat. Furthermore, two-way communication between the intelligent components inside the system ensures precise coordination of operation to achieve optimized comfort AND efficiency. A homeowner can see and give their dealer the fault code and possible causes to help prepare for a service call. Once on the job, a dealer can see what the operating conditions of the unit were at the time of the fault, to help narrow down diagnosis.

## Internal Variable Speed Water Flow Control

Employing the revolutionary communicating system, Variable Water Flow (VWF) brings another industry first - internal variable water flow control. The system facilitates intelligent communication between the thermostat, communicating controls and internal water pump/valve to make true variable water flow a reality. Compared to conventional units that can just turn the water-flow on or off, the HE Series varies the water-flow, which results in significantly lower operating cost and longer system life. Comfort-Aire/Century takes ease and speed of installation of geothermal heating and cooling systems to the next level. VWF integrates water-flow control inside the unit.

## One Inch Merv 8 Filter

All units include a factory installed 1" filter frame/duct collar with a 1" pleated high efficiency MERV 8 air filter.

## ENERGY STAR® Most Efficient – Communicating AND Efficient

The HE Series has been recognized as ENERGY

STAR® Most Efficient for both exceeding stringent efficiency requirements AND for meeting 2-way communication requirements. With these systems the customer is getting both an EFFICIENT system and an INTELLIGENT system – buying a system can't get SMARTER than that!

## Easy to Install, Easy to Service – A Technician's Dream Machine

Comfort-Aire/Century has designed the HE units with the technician in mind. From industry-exclusive VWF, with built-in water flow components that cut down on installation time and space, to easy access panels, to a swing out control panel (exclusive to Comfort-Aire/Century), to refrigerant pressure ports right in the front of the unit, to easy connect water connections... the list goes on and on. The new digital 2-way controls make understanding unit faults significantly easier by displaying information on the thermostat.

# Communicating Controls

## **Two-Way Communicating System and a Gateway Into the HE System**

HE is equipped with industry first, – Information Gateway – communicating system that allow users to interact with their geothermal system in plain English AND delivers improved reliability and efficiency by precisely controlling smart variable speed components.

### Precise operation:

The Microprocessor on the new DXM2 board enables intelligent, 2-way communication between the DXM2 board and smart components like the communicating thermostat, fan motor, and water pump. The control can also directly control the modulating valve and accepts various feedback/input (see figure). The Intelligent DXM2 board uses information received from the smart components and sensors to precisely control operation of variable speed fan, variable speed water pump (or modulating valve) to deliver higher efficiency, reliability and increased comfort.

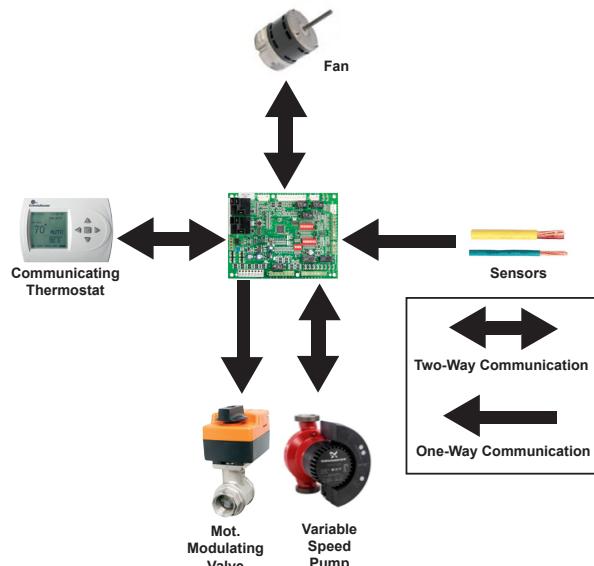

## Plain English communication:

Digital controls allow users to interact with their HE system in PLAIN ENGLISH, through digital communicating thermostat (ATC) or configuration / diagnostic tool (ACDU). It enables configuration, monitoring and diagnostics of the system from the thermostat.

**Configuration** – Installers can configure the units from the thermostat, including: Air flow, entering/leaving water  $\Delta T$ , water-flow option configuration, unit configuration, accessory configuration, and demand reduction (optional, to limit unit operation during peak times).

Monitoring and Diagnostics – In the rare case there's an issue with the unit, the unit will communicate "Service needed" to the thermostat for consumers to see. From the thermostat, a consumer can also access dealer information (if programmed), fault description, possible causes and current system status (temperature readings, fan RPM and water flow status) to help the servicing contractor understand what's happening with the unit even before a service visit. Once the installer is on the job, in "service mode", the servicing contractor can diagnose the units much faster with possible causes shown on the thermostat and with system operating conditions at the time of the fault.

With the communicating system, consumers and contractors have a gateway to system information that no other geothermal system offers as standard at this time.

# Internal Variable Water Flow (VWF) Control

## Internal Variable Water Flow (VWF)

Industry-first, built-in VWF replaces a traditionally inefficient, external component of the geothermal system (water circulation) with an ultra-high-efficient, variable speed, internal water flow system. This saves homeowners 70-80% on operating water circulator vs traditional single speed pump systems. It saves installers time and labor by avoiding installing bulky external flow centers or flow regulators. Multi-unit installations are also much simpler with VWF systems, as the units automatically adjust water flow across the system.

VWF is enabled by our digital controls, which facilitates intelligent communication between the thermostat, DXM2 control, sensors and internal water pump/valve to make true variable water flow a reality.

### VWF is available for three applications:

- 1) Closed loop – individual unit pumping: VWF Internal Flow Controller model "2" (high head) ("2" in Position 11 of the unit model number) would be used. This includes variable speed pump, flushing ports, 3 way flushing valves and expansion tank. Copper water coil is standard with this option.
- 2) Closed loop – multi unit / central pumping: VWF Internal Low Pressure Drop (high Cv) Motorized Modulating Valve ("5" in Position 11 of the unit model number) would be used. Copper water coil is standard with this option.
- 3) Open loop: VWF Internal Motorized Modulating Valve ("6" in Position 11 of the unit model number) would be used. Cupro-Nickel water coil is standard with this option. Valves in open loop models have higher pressure drop than the valves in the closed loop (modulating valve) models for better flow control when used in systems with higher pressure water supply pumps, and are not recommended for closed loop applications.

### VWF delivers three main benefits:

- 1) Easier and quicker unit installation as the flow control is built in to the unit.
- 2) Superior reliability by varying the water flow to deliver more stable operation.
- 3) Higher cost savings by varying the flow (and pump watt consumption) to match the unit's mode of operation.

### Internal components

HE Series can be installed more easily and compactly than its predecessors because water-flow components are internal to the unit. It also saves installing contractors labor and time by eliminating the need for an external flow regulator or a bulky external pumping module.

### Variable flow

VWF technology enables variable water flow through the unit, with the DXM2 control adjusting the pump speed to maintain an installer-set loop  $\Delta T$ . By controlling the water flow, the system is able to operate at its optimal capacity and efficiency. VWF provides a lower flow rate for part load where units typically operate 80% of the time and a higher, more normal flow rate for full load operation.

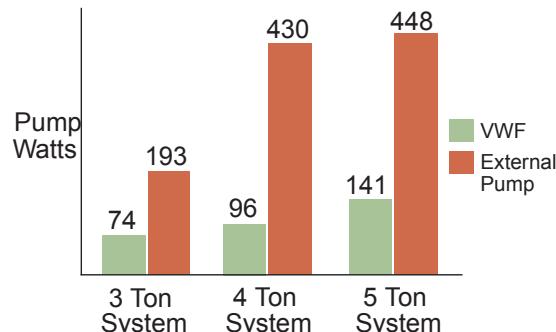

### Energy Savings with water circulation control

Units with VWF deliver higher operating cost savings by varying the water flow to match the unit's operation (ex: lower water flow when unit is in part load operation). Lowering the flow results in lower energy consumption by the water pump (=higher cost savings) in VWF units (whether internal or external pump).

In closed loop applications, using VWF with an internal variable-speed (ECM) flow controller, the ECM pump uses fewer watts than a fixed speed (PSC) pump, even at full load (see chart). The ECM pump excels in energy savings in part load, saving 70-80% watts compared to fixed speed pumps (see chart). The ECM pump can operate with independent flow rates for heating and cooling, further saving even more energy.

In open loop applications, when the motorized modulating valve slows down the water flow during part load operation, the external pump consumes fewer watts, thus saving more energy.

# How to Use this Manual

As with any unit selection the first step is to perform a proper load calculation. Once the design cooling and heating loads are known the predominant load can be used to select the appropriate unit. In northern climates the heating load may be used to select the unit, whereas in southern climates the cooling load may be used. Likewise, the anticipated maximum EWT should be used for the cooling mode and the minimum anticipated EWT should be used when selecting for the heating mode. These EWTs may be the same temperature in the case of a ground water application.

Use the Full Load performance pages to select the unit size. Once the unit size is determined read the associated flow rate (gpm) for the needed capacity. Typically this is 1.5 – 2 gpm/nominal ton for ground water applications and 2.25 – 3 gpm/ton for ground loop applications.

## For Closed Loop Applications

For closed loop systems where an internal circulating pump is desired, the HE units can be ordered with an internal, variable speed loop circulator. This would typically be for a ground loop or secondary pumping application. This internal loop circulator is the variable speed Grundfos Magna 25-140 for all HE units. The Grundfos UPM 25-85 is also available for size 024 and 036. Units with UPM pumps should not be combined with units with Magna pumps on the same loop. UPM pumps are best suited for small applications with a single unit. The maximum possible pump curve is shown below. The pump can also operate at any point below the curve as a “partial load” pumping condition. The designer/installer should use the information presented in this manual to determine the available pump head for any external piping/accessories and ground loop (if applicable). This can be done in the following manner.

1. Determine the desired flow rate through the unit from the performance pages (as described above). Read the associated pressure drop in feet of head for the worst case condition (lowest anticipated entering water temperature) at the required flow rate.
2. Determine the maximum pump head from the pump curve associated with the required flow rate from step 1.
3. Subtract the unit pressure drop (from step 1) from the maximum available pump head (from step 2).
4. The remainder is the available pump head to overcome any external piping/accessories and the ground loop.

If the available pump head is equal to or greater than the calculated external piping and loop pressure drop, no other steps are required. If the available pump head is less than the calculated pressure drop of all external piping and the loop, then changes to the loop design should be considered.

Typically residential loops consist of  $\frac{3}{4}$ " circuit piping and 1  $\frac{1}{4}$ " supply and return piping. If the available pump head is less than the calculated pressure drop of all external piping and the loop, it is recommended that larger pipe sizes be investigated such as 1" circuit piping and/or 1  $\frac{1}{2}$ " or 2" supply and return piping. This will significantly reduce system pressure drop with little change in Reynolds number. If this causes the

Reynolds number to fall to an unacceptable level, try reducing the overall number of circuits. This will increase the flow rate through each circuit, increasing the Reynolds number.

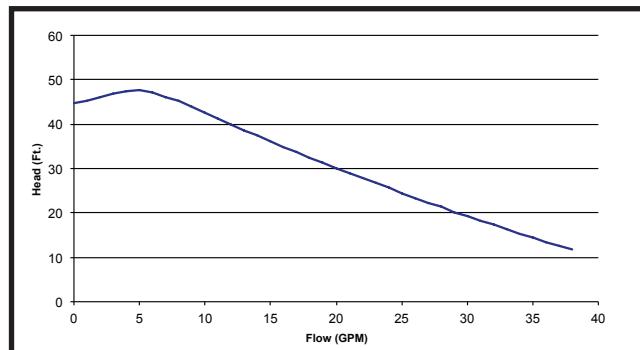

Another solution might be to allow the system flow rate to be reduced. Typical geothermal flow rates are between 2.25 and 3 gpm/ton. As long as the system flow rate using the internal variable speed circulator is at or above 2.25 gpm/ton it is safe to operate the system. A quick review of the unit performance tables will show that this causes very little change in unit performance.

For secondary pumping applications follow the above steps except do not consider the pressure drop of the loop. The internal 25-140 circulator will only need to overcome the pressure drop of the unit and any piping connecting the unit to the primary loop.

The HE Series can also be ordered with an internal modulating water control valve for closed loop systems with multiple units and a central pump. In this case the modulating water valve will stop water flow through the unit when the unit is not operating and control the flow rate through the unit during operation, saving pumping energy in both cases.

When using an internal modulating water valve the central pump must be able to overcome the pressure drop of the valve in addition to the pressure drop of the unit. Because of

## How to Use this Manual

this, internal modulating valves for closed loop systems are designed with a low pressure drop in mind. The minimum pressure drop for the internal closed loop valve is shown in the 'Modulating Valves for Closed Loop Applications' table. This pressure drop should be added to the unit pressure drop when determining system pressure drop for central pump selection.

### For Open Loop Applications

The HE units can also be ordered with the internal modulating water control valve for open loop systems with an external well pump. In this case the modulating water valve will stop water flow through the unit when the unit is not operating and act as a flow control device to control the flow rate through the unit during operation.

When using an internal modulating water valve the external pump must be able to overcome the minimum pressure drop of the valve in addition to the pressure drop of the unit. The minimum pressure drop for the open loop internal valve is shown in the 'Modulating Valves for Open Loop Applications' table below. This pressure drop should be added to the unit pressure drop when determining overall equipment pressure drop.

# HE Design Features

The HE Digital Series has abundant features and ultra-high efficiency.

## Application Flexibility

- Six Capacities 024, 030, 036, 042, 048 and 060 KBTUH
- Entering water temperature operation range (20-120°F EWT) and flow rates as low as 1.5 gpm per ton
- Two-stage upflow and horizontal right or left return
- Optional external electric heat unit designed for easy field installation
- Exceeds the federal requirements for 30% tax credit on installation costs
- Field selectable low-temperature protection settings for GWHP or GLHP installations
- Standard pre-installed 1" with 1" high performance MERV 8 pleated air filter
- Integrated VWF functionality for most geothermal applications

## Operating Efficiencies

- Exceeds ASHRAE 90.1 and Energy Star® Tier 3 efficiency levels
- Energy Star® Most Efficient
- 410A zero ozone depletion refrigerant.
- Rugged and highly efficient next generation Copeland UltraTech™ 2-stage scroll compressors provide ultra-high efficiencies and unsurpassed comfort.
- Optional hot water generator with advanced control logic and internally mounted pump.
- Convoluted copper (and optional cupro-nickel) water tube functions efficiently at low-flow rates and provides low-temperature-damage resistance.
- Tin plated, rifled tube/lanced aluminum fin, air to refrigerant heat exchangers provide high efficiency at low face velocity
- Large low RPM blowers with variable speed ECM fan motors provide quiet, efficient air movement with high static capability. Installer selectable ECM air flow provides the ultimate in comfort optimization.

## Service & Installation Advantages

The HE Series incorporates features that are industry firsts, which make it extremely easy to install:

- Ease of installation:
  - 1) VWF - with the industry exclusive features, these units are ready to install out of the box with no requirement for external pumps, expansion tanks, or valves for the ground loop removing a lot of the complexity of installation.
  - 2) Full digital controls that communicate with the thermostat which allows all unit configuration from the thermostat... the easiest installation setup for any level of installer. Far simpler than the use of dip-switches on the unit control board.
- The HE only requires 4 wires between the communicating thermostat and the unit. Others require up to 9 or 14 wires for full functionality. This is achieved by leveraging the full power of the microprocessor on the control.
- Internal variable speed circulator includes an internal check valve for multiple unit/ shared loop installations.
- Standard cornerpost schreader ports provide access to source pressure drop across unit coaxial heat exchanger.

- The communicating DXM2 control board diagnostic and communicating thermostat features allow the home owner to tell the service technician what is wrong with the unit before the technician leaves the shop.
- Small footprint: The small size of the units allows the dealer to install this unit in places they either (1) couldn't install before or (2) were very tight fit before, like 2.0/3.0 door jams, small mechanical closets, attic doors and crawl spaces.
- The two-section swing-out and removable control box design provides wide-open service access to the compressor section. Multiple unit access panels allow technicians to access any side of the cabinet. Service friendly highly accessible high/low refrigerant pressure ports are located on a service bracket at the front of the unit. No other product / manufacturer in the geothermal segment offer this convenience.
- An innovative two-section electrical control box design that tucks the stationary line voltage components safely behind a swing-out low voltage control panel to provide clear service access through the front of the unit. The low voltage panel can even be quickly pulled off the hinges and removed. Harness connections make controller replacement a snap.
- $\frac{3}{4}$ " MPT condensate connection directly from condensate drain pan eliminates internal plastic drain tubing that is subject to clogging and avoids the need for a fitting that reduces the drain opening size.
- Diagnostic display of system inputs, outputs, and configuration settings at thermostat or Configuration/Diagnostic tool.
- Diagnostic display of system temperatures at thermostat (ATC32U\*\*):
  - Geo source in and out
  - Compressor discharge line
  - LT1 and LT2 Refrigerant Line Temperature Sensors
  - Leaving air
  - Entering potable hot water to HWG
- Immediate manual control of all DXM2 outputs is available at the thermostat (ATC32U\*\*) or Configuration/Diagnostic tool (ACDU\*\*) for rapid troubleshooting.
- Expansion tank eliminates "flat loop" callbacks by working to maintain steady loop pressure.
- Brass swivel geo and hot water connections for quick connection and elimination of wrenches or sealants during installation.
- Intelligent fault retry with history retention.
- Two configurable auxiliary relays for low voltage control of accessories.
- UPS (Unit Performance Sentinel) provides early warning of inefficient operation.

## Factory Quality & Industry Certifications

All units are built and factory run tested on our Integrated Process Control Assembly System (IPCS). The IPCS is a unique state of the art manufacturing system that is designed to assure quality of the highest standards of any manufacturer in the water-source industry. Our IPCS system:

- Verifies that the correct components are being assembled.
- Automatically performs special leak tests on all joints
- Conducts pressure tests
- Performs detailed run test

# HE Design Features

- Automatically disables packaging for a “failed” unit
- Creates computer database for future service analysis and diagnostics from run test results
- All refrigerant brazing is done in a nitrogen atmosphere
- All units are deep evacuated to less than 100 microns prior to refrigerant charging
- All joints are both helium and halogen leak tested to insure annual leak rate of less than  $\frac{1}{4}$  ounce
- AHRI/ASHRAE/ANSI/ISO 13256-1 certified.
- ETL listed.
- US EPA “Energy Star” Tier 3 compliant.

## Advanced Controls

Digital communicating controls provide advanced unit functionality and comprehensive configuration, monitoring and diagnostic capabilities through digital communication links with the variable-speed fan motor, variable-speed source pump (or modulating valve) and communicating thermostat or Configuration/Diagnostic tool.

- 7 temperature sensor inputs for system protection and control
- Anti-short cycle and over/under voltage protection
- High pressure, loss of charge, and condensate overflow protection
- LED fault and status indication at controller
- Service tool port for optional setup and diagnostics at unit

- 1 Exclusive Two-Way Communicating Control to configure, monitor and diagnose AT THERMOSTAT
- 2 Internal Variable Water Flow System with Internal Flow Center or Internal Motorized Modulating Valve for optimized efficiency and reliability
- 3 Next generation Copeland™ Ultra-Tech™ Two-Stage Scroll Compressor with dual-level isolation for ultra-quiet and high-efficiency operation
- 4 Emerson UltraTech® Variable-Speed Communicating Fan Motor with soft start and constant CFM control
- 5 Tin-Plated Copper Air Coils to resist formicary corrosion
- 6 Foil-Faced Insulation in the blower section and fully insulated compressor section conform to ASHRAE 62 specifications
- 7 One-inch high-efficiency MERV 11 Filter (standard) or EarthPure® Air Cleaner for high quality indoor air
- 8 Two-Section Swing-out Control Box design provides wide-open service access
- 9 Refrigerant Schrader Ports Located on bracket at the front access panel for easy service access
- 10 Water Schrader Ports located on corner post to easily read pressure drop across water heat exchanger for easy troubleshooting

## Factory Options and Accessories

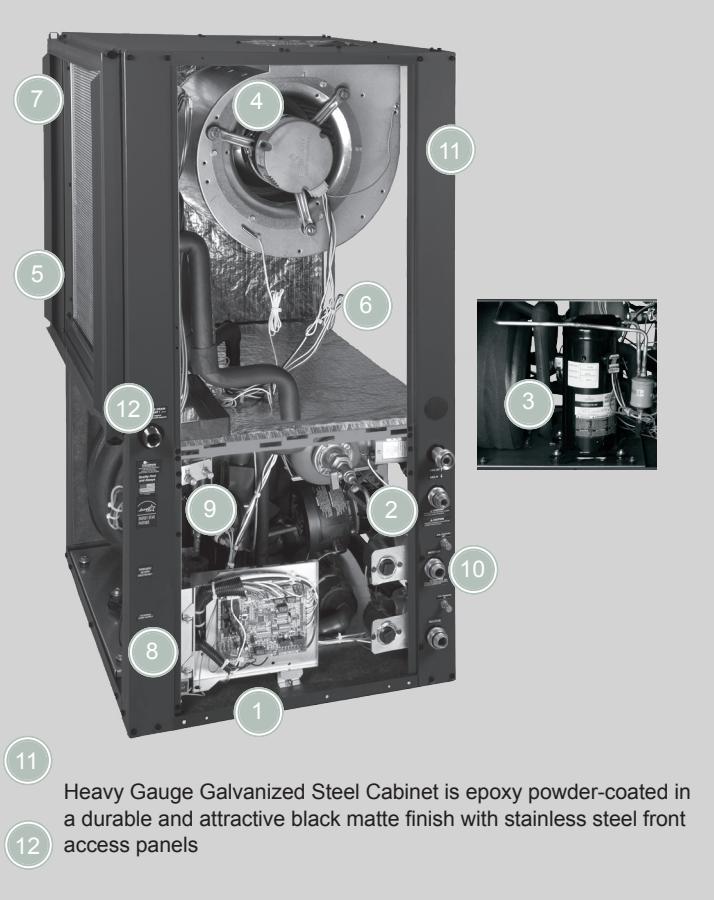

- Hot water generator with internally mounted pump and advanced logic control

## Field Installed Accessories

- Communicating, Programmable Thermostat (ATC32U\*\*)
- Auxiliary Electric Heater
- Configuration / Diagnostic Tool (ACDU\*\*)
- Outdoor/Remote Temperature Sensor (AST008)
- Secure Start Compressor Soft Start Kit (13B0045N01)
- Unit Vibration Isolation Pad
- Unit Stand
- Secondary Drain Pan (Horizontal Units)

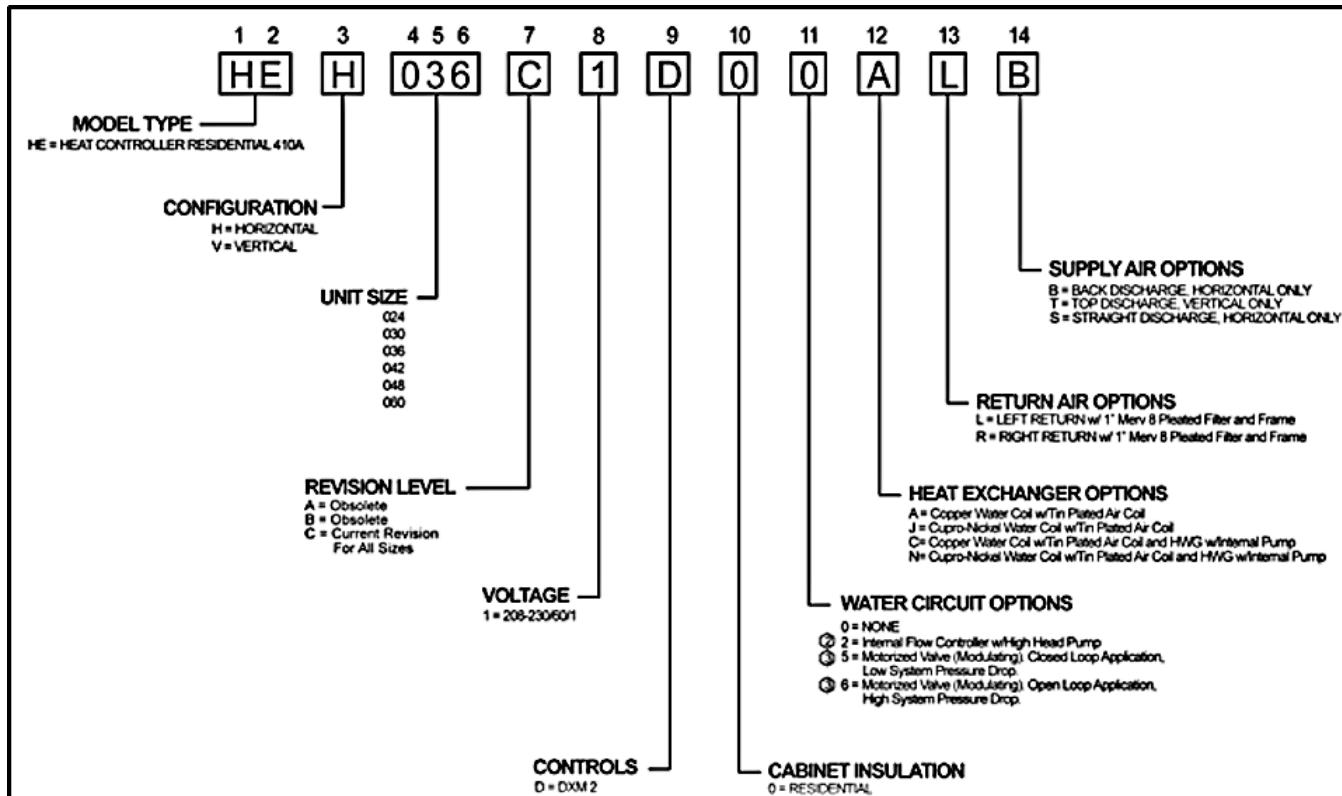

## Warranty

- Comfort-Aire/Century residential class heat pumps are backed by a 12-year limited warranty on all unit parts, including the following accessories when installed with Comfort-Aire/Century units: Flow Controllers, Thermostats & Electric Heaters.
- Comfort-Aire/Century goes even further to back up its commitment to quality by including a service labor allowance for the first five years on unit parts and thermostats, auxiliary electric heaters and geothermal pumping modules with completion of Start Up Form.

11 Heavy Gauge Galvanized Steel Cabinet is epoxy powder-coated in a durable and attractive black matte finish with stainless steel front access panels

Ground Loop Heat Pump ratings based on 15% methanol antifreeze solution

All ratings based upon operation at lower voltage of dual voltage rated models

**About AHRI/ISO/ASHRAE 13256-1**

AHRI/ASHRAE/ISO 13256-1 (Air-Conditioning and Refrigeration Institute/American Society of Heating, Refrigerating and Air Conditioning Engineers/International Standards Organization) is a certification standard for water-source heat pumps used in the following applications:

- WLHP (Water Loop Heat Pump – Boiler/Tower)
- GWHP (Ground Water Heat Pump – Open Loop)
- GLHP (Ground Loop Heat Pump – Geothermal)

The directory at <http://www.ahrinet.org/> is constantly being updated and immediately available on the Internet.

Water and air temperatures used in AHRI certification standards are shown below.

Test Condition Comparison Table	WLHP	GWHP	GLHP
<b>Cooling</b> Entering Air Temperature - DB/WB °F [°C] Entering Water Temperature - °F [°C] Fluid Flow Rate	80.6/66.2 [27/19] 86 [30] *	80.6/66.2 [27/19] 59 [15] *	80.6/66.2 [27/19] 77 [25] *
<b>Heating</b> Entering Air Temperature - DB/WB °F [°C] Entering Water Temperature - °F [°C] Fluid Flow Rate	68 [20] 68 [20] *	68 [20] 50 [10] *	68 [20] 32 [0] *

\*Flow rate is specified by the manufacturer

Data certified by AHRI include heating/cooling capacities, EER (Energy Efficiency Ratio – Btuh per Watt) and COP (Btuh per Btuh) at the various conditions shown above. Pump power correction is calculated to adjust efficiencies for pumping Watts. Fan power is corrected to zero external static pressure using the equation below. The nominal airflow is rated at a specific external static pressure.

$$\text{Fan Power Correction} = (\text{cfm} \times 0.472) \times (\text{esp} \times 249)/300$$

Capacities and efficiencies are calculated using the following equations:

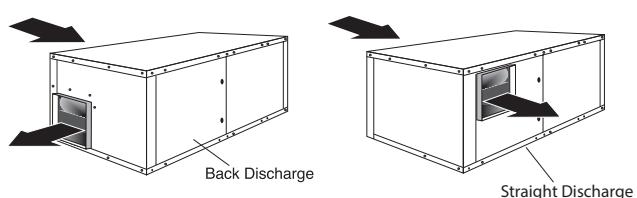

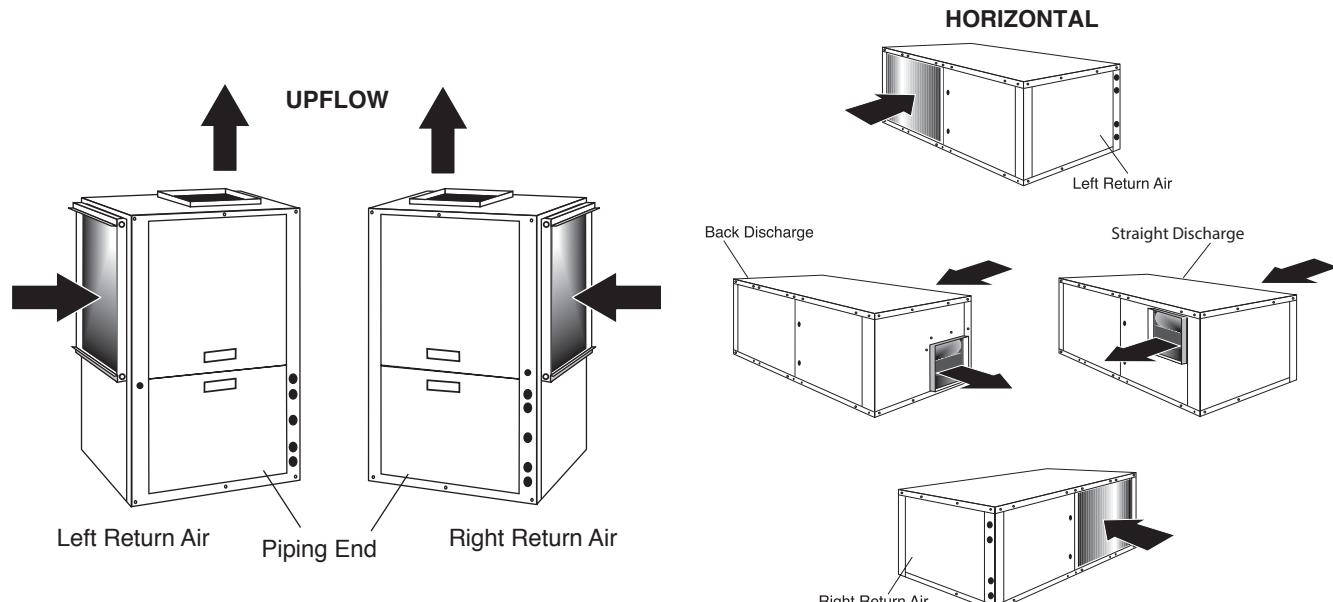

- ISO Cooling Capacity = Cooling Capacity (Btuh) + [Fan Power Correction (Watts) x 3.412]
- ISO EER Efficiency (Btuh/W) =  
ISO Cooling Capacity (Btuh)/[Power Input (Watts) – Fan Power Correction (Watts) + Pump Power Correction (Watts)]
- ISO Heating Capacity = Heating Capacity (Btuh) – [Fan Power Correction (Watts) x 3.412]
- ISO COP Efficiency (Btuh/Btuh) =  
ISO Heating Capacity (Btuh) x 3.412/[Power Input (Watts) - Fan Power Correction (Watts) + Pump Power Correction (Watts)]

## Reference Calculations & Legend

Heating	Cooling
$LWT = EWT - \frac{HE}{GPM \times 500}$	$LWT = EWT + \frac{HR}{GPM \times 500}$
$LAT = EAT + \frac{HC}{CFM \times 1.08}$	$LC = TC - SC$ $LAT (DB) = EAT (DB) - \frac{SC}{CFM \times 1.08}$ $S/T = \frac{SC}{TC}$

Hot Water Generator capacities (HWC) are based on potable water flow rate of 0.4 gpm per nominal equipment ton and 90°F entering potable water temperature.

CFM	= airflow, cubic feet/minute	HE	= total heat of extraction, Mbtuh
EWT	= entering water temperature, °F	HWC	= Hot Water Generator (desuperheater) capacity, Mbtuh
GPM	= water flow in US gallons/minute	WPD	= Water coil pressure drop (psi & ft hd)
EAT	= entering air temperature, Fahrenheit (dry bulb/wet bulb)	EER	= Energy Efficiency Ratio = BTU output/Watt input
HC	= air heating capacity, Mbtuh	COP	= Coefficient of Performance = BTU output/BTU input
TC	= total cooling capacity, Mbtuh	LWT	= leaving water temperature, °F
SC	= sensible cooling capacity, Mbtuh	LAT	= leaving air temperature, °F
KW	= total power unit input, KiloWatts	LC	= latent cooling capacity, Mbtuh
HR	= total heat of rejection, Mbtuh	S/T	= sensible to total cooling ratio

# Performance Data Selection Notes - Variable Water Flow (VWF) Models

## Operation in Shaded Area: Closed Loop Application

For operation in the shaded area, appropriate levels of a proper antifreeze should be used in systems with leaving water temperatures of 40°F or below and the JW3 jumper should be clipped. This is due to the potential of the refrigerant temperature being as low as 32°F [0°C] with 40°F [4.4°C] LWT, which may lead to a nuisance cutout due to the activation of the Low Temperature Protection. JW3 should never be clipped for systems without antifreeze.

## Open Loop Application:

For operation in shaded area (below 40°F LWT) in open loop applications,  $\Delta T$  (on DXM2) should be set such that the LWT (=EWT -  $\Delta T$ ) doesn't drop below 40°F. JW3 should NEVER be clipped for systems without antifreeze.

## Performance Data Selection Notes - Models without VWF

For operation in the shaded area when water is used in lieu of an antifreeze solution, the LWT (Leaving Water Temperature) must be calculated. Flow must be maintained to a level such that the LWT is maintained above 40°F [4.4°C] when the JW3 jumper is not clipped (see example below). Otherwise, appropriate levels of a proper antifreeze solution should be used in systems with leaving water temperatures of 40°F [4.4°C] or below and the JW3 jumper should be clipped. This is due to the potential of the refrigerant temperature being as low as 32°F [0°C] with 40°F [4.4°C] LWT, which may lead to a nuisance cutout due to the activation of the Low Temperature Protection. JW3 should never be clipped for standard range equipment or systems without antifreeze.

### Example:

At 50°F EWT (Entering Water Temperature) and 1.5 gpm/ton, a 3 ton unit has a HE of 22,500 Btuh. To calculate LWT, rearrange the formula for HE as follows:

HE = TD x GPM x 500, where HE = Heat of Extraction (Btuh);  
TD = temperature difference (EWT - LWT) and GPM = U.S. Gallons per Minute.

$$TD = HE / (GPM \times 500)$$

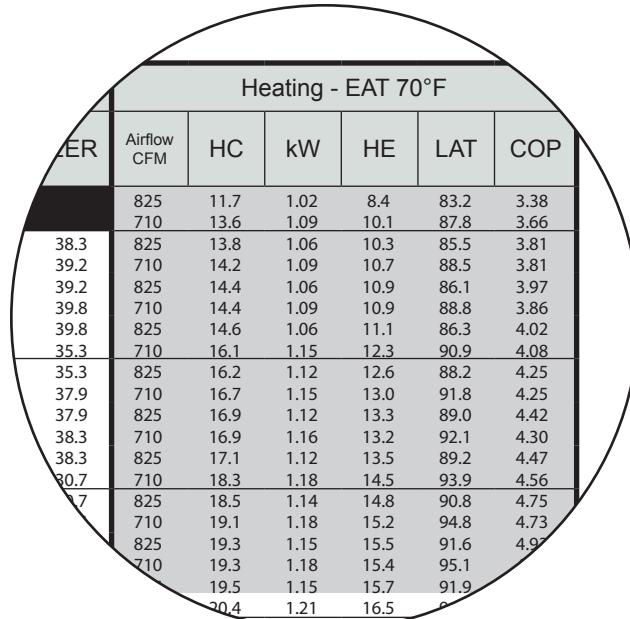

$$TD = 22,500 / (4.5 \times 500)$$

$$TD = 10^{\circ}\text{F}$$

$$LWT = EWT - TD$$

$$LWT = 50 - 10 = 40^{\circ}\text{F}$$

In this example, as long as the EWT does not fall below 50°F, the system will operate as designed. For EWTs below 50°F, higher flow rates will be required (open loop systems, for example, require at least 2 gpm/ton when EWT is below 50°F).

## Antifreeze Correction Table

# Performance Data — HE Model 030 - Full Load, with VWF

Performance capacities shown in thousands of Btu/h

Antifreeze use recommended in this range. Also Clip JW3 on DXM2 board.

EWT °F	Cooling - EAT 80/67°F										Heating - EAT 70°F

## Performance Data — HE Model 042 - Part Load, with VWF

Performance capacities shown in thousands of Btu/h

Antifreeze use recommended in this range. Also Clip JW3 on DXM2 board.

EWT °F	Cooling - EAT 80/67°F										Heating - EAT 70°F

# Performance Data — HE Model 048 - Full Load, with VWF

Performance capacities shown in thousands of Btu/h

Antifreeze use recommended in this range. Also Clip JW3 on DXM2 board.

EWT °F	Cooling - EAT 80/67°F										Heating - EAT 70°F

Interpolation is permissible; extrapolation is not.

Flow is changed to maintain minimum LWT 60°F in cooling and maximum LWT 70°F in heating.  
Table does not reflect fan or pump power corrections for AHR/ISO conditions.

All performance is based upon the lower voltage of dual voltage rated units.

Operation at or below 40°F EWT is based on 15% methanol antifreeze solution.

See Performance correction tables for operating conditions other than those listed above.

Interpolation is permissible, extrapolation is not. All performance data is based on the lower voltage of dual voltage units.

Performance stated is at the rated power supply, performance may vary as the power supply varies from the rated.

Table is with entering air of 80°F DB and 67°F WB in cooling, and 70°F DB in heating.

AHRI/ISO certified conditions are 80.6°F DB and 66.2°F WB in cooling and 68°F DB in heating.

Table does not reflect fan or pump power corrections for AHRI/ISO conditions.

See performance correction tables for operating conditions other than those listed above. See performance data selection notes for operation in the shaded areas.

Operation below 40°F EWT is based on a 15% methanol antifreeze solution.

Operation below 60°F EWT requires optional extended range insulated water and refrigerant circuits to avoid condensation within the unit cabinet.

# Performance Data — HE Model 030 - Part Load, Non VWF

Interpolation is permissible, extrapolation is not. All performance data is based on the lower voltage of dual voltage units.

Performance stated is at the rated power supply, performance may vary as the power supply varies from the rated.

Table is with entering air of 80°F DB and 67°F WB in cooling, and 70°F DB in heating.

AHRI/ISO certified conditions are 80.6°F DB and 66.2°F WB in cooling and 68°F DB in heating.

Table does not reflect fan or pump power corrections for AHRI/ISO conditions.

See performance correction tables for operating conditions other than those listed above. See performance data selection notes for operation in the shaded areas.

Operation below 40°F EWT is based on a 15% methanol antifreeze solution.

Interpolation is permissible, extrapolation is not. All performance data is based on the lower voltage of dual voltage units.

Performance stated is at the rated power supply, performance may vary as the power supply varies from the rated.

Table is with entering air of 80°F DB and 67°F WB in cooling, and 70°F DB in heating. AHRI/ISO certified conditions are 80.6°F DB and 66.2°F WB in cooling and 68°F DB in heating.

Table does not reflect fan or pump power corrections for AHRI/ISO conditions. See performance correction tables for operating conditions other than those listed above. See performance data selection notes for operation in the shaded areas. Operation below 40°F EWT is based on a 15% methanol antifreeze solution. Operation below 60°F EWT requires optional extended range insulated water and refrigerant circuits to avoid condensation within the unit cabinet.

Interpolation is permissible, extrapolation is not. All performance data is based on the lower voltage of dual voltage units.

Performance stated is at the rated power supply, performance may vary as the power supply varies from the rated.

Table is with entering air of 80°F DB and 67°F WB in cooling, and 70°F DB in heating.

AHRI/ISO certified conditions are 80.6°F DB and 66.2°F WB in cooling and 68.6°F DB in heating.

Table does not reflect fan or pump power corrections for AHRI/ISO conditions.

See performance correction tables for operating conditions other than those listed above. See performance data selection notes for operation in the shaded areas.</

Interpolation is permissible, extrapolation is not. All performance data is based on the lower voltage of dual voltage units.

Performance stated is at the rated power supply, performance may vary as the power supply varies from the rated.

Table is with entering air of 80°F DB and 67°F WB in cooling, and 70°F DB in heating.

AHRI/ISO certified conditions are 80.6°F DB and 66.2°F WB in cooling and 68.6°F DB in heating.

Table does not reflect fan or pump power corrections for AHRI/ISO conditions.

See performance correction tables for operating conditions other than those listed above. See performance data selection notes for operation in the shaded areas.

Operation below 40°F EWT is based on a 15% methanol antifreeze solution.

Operation below 60°F EWT requires optional extended range insulated water and refrigerant circuits to avoid condensation within the unit cabinet.

Interpolation is permissible, extrapolation is not. All performance data is based on the lower voltage of dual voltage units.

Performance stated is at the rated power supply, performance may vary as the power supply varies from the rated.

Table is with entering air of 80°F DB and 67°F WB in cooling, and 70°F DB in heating.

AHRI/ISO certified conditions are 80.6°F DB and 66.2°F WB in cooling and 68°F DB in heating.

Table does not reflect fan or pump power corrections for AHRI/ISO conditions.

See performance correction tables for operating conditions other than those listed above. See performance data selection notes for operation in the shaded areas.

Operation below 40°F EWT is based on a 15% methanol antifreeze solution.

Operation below 60°F EWT requires optional extended range insulated water and refrigerant circuits to avoid condensation within the unit cabinet.

Interpolation is permissible, extrapolation is not. All performance data is based on the lower voltage of dual voltage units.

Performance stated is at the rated power supply, performance may vary as the power supply varies from the rated.

Table is with entering air of 80°F DB and 67°F WB in cooling, and 70°F DB in heating. AHRI/ISO certified conditions are 80.6°F DB and 66.2°F WB in cooling and 68.6°F DB in heating.

Table does not reflect fan or pump power corrections for AHRI/ISO conditions.

See performance correction tables for operating conditions other than those listed above. See performance data selection notes for operation in the shaded areas.

Operation below 40°F EWT is based on a 15% methanol antifreeze solution.

Operation below 60°F EWT requires optional extended range insulated water and refrigerant circuits to avoid condensation within the unit cabinet.

Interpolation is permissible, extrapolation is not. All performance data is based on the lower voltage of dual voltage units.

Performance stated is at the rated power supply, performance may vary as the power supply varies from the rated.

Table is with entering air of 80°F DB and 67°F WB in cooling, and 70°F DB in heating.

AHRI/ISO certified conditions are 80.6°F DB and 66.2°F WB in cooling and 68°F DB in heating.

Table does not reflect fan or pump power corrections for AHRI/ISO conditions.

See performance correction tables for operating conditions other than those listed above. See performance data selection notes for operation in the shaded areas.

Operation below 40°F EWT is based on a 15% methanol antifreeze solution.

Operation below 60°F EWT requires optional extended range insulated water and refrigerant circuits to avoid condensation

## Performance Data — HE Model 060 - Part Load, Non VWF

Interpolation is permissible, extrapolation is not. All performance data is based on the lower voltage of dual voltage units.

Performance stated is at the rated power supply, performance may vary as the power supply varies from the rated.

Table is with entering air of 80°F DB and 67°F WB in cooling, and 70°F DB in heating.

AHRI/ISO certified conditions are 80.6°F DB and 66.2°F WB in cooling and 68°F DB in heating.

Table does not reflect fan or pump power corrections for AHRI/ISO conditions.

See performance correction tables for operating conditions other than those listed above. See performance data selection notes for operation in the shaded areas.&lt;/div

## ECM Blower Control

The ECM fan is controlled directly by the DXM2 control board that converts thermostat inputs and CFM settings to signals used by the ECM motor controller. To take full advantage of the ECM motor features, a communicating multi-stage thermostat should be used (ATC32U\*\*).

The DXM2 control maintains a selectable operating airflow [CFM] for each heat pump operating mode. For each operating mode there are maximum and minimum airflow limits. See the ECM Blower Performance tables for the maximum, minimum, and default operating airflows.

Airflow levels are selected using the configuration menus of a communicating thermostat (ATC32U\*\*) or diagnostic tool (ACDU\*\*). The configuration menus allow the installer to independently select and adjust the operating airflow for each of the operating modes. Air flow can be selected in 25 CFM increments within the minimum and maximum limits shown in the ECM Blower Performance Table. The blower operating modes include:

- First Stage Cooling (Y1 & O)
- Second Stage Cooling (Y1, Y2, & O)
- First Stage Cooling in Dehumidification Mode (Y1, O, & Dehumid)
- Second Stage Cooling in Dehumidification Mode (Y1, Y2, O, & Dehumid)
- First Stage Heating (Y1)
- Second Stage Heating (Y1 & Y2)
- Third Stage (Auxiliary) Heating (Y1, Y2, & W)
- Emergency Heating (W with no Y1 or Y2)
- Fan (G with no Y1, Y2, or W)

It is highly recommended that ATC32U\*\* or ACDU\*\* be used to set dehumidification mode electronically. Dehumidification can NOT be selected when using a non-communicating thermostat with a VWF unit with Internal Flow Controller (pump). For dehumidification settings on other units using the non-communicating stat, refer to DXM2 AOM.

The ECM motor includes “soft start” and “ramp down” features. The soft start feature is a gentle increase of motor rpm at blower start up. This creates a much quieter blower start cycle.

The ramp down feature allows the blower to slowly decrease rpm to a full stop at the end of each blower cycle. This creates a much quieter end to each blower cycle and adds overall unit efficiency.

The ramp down feature is eliminated during an ESD (Emergency Shut Down) situation. When the DXM2 ESD input is activated, the blower and all other control outputs are immediately de-activated.

The ramp down feature (also known as the heating or cooling “Off Delay”) is field selectable by the installer. The allowable range is 0 to 255 seconds.

### Airflow Configuration Screen on Communicating Thermostat

AIRFLOW SELECTION		CFM
HEAT STAGE 1		600
HEAT STAGE 2		750

All Fuses UL Class K general purpose

# Accessories, Options, & Warranty

## Accessories & Options

### **Hot Water Generator**

An optional insulated heat reclaiming desuperheater coil of vented double-wall copper construction suitable for potable water shall be provided. The coil, hot water circulating pump, and associated controls shall be factory mounted inside the unit cabinet. Sensors mounted on the compressor discharge line and the potable water inlet shall transmit temperatures to the unit microprocessor where internal logic will determine when hot water generation is feasible. The microprocessor shall cycle the pump periodically during unit operation to sample the DHW tank temperature. The microprocessor shall include multiple temperature set points to select from for hot water generation control.

### **Cupro-Nickel Heat Exchanger**

An optional corrosion resistant CuNi coaxial heat exchanger shall be factory installed in lieu of standard copper construction.

### **Thermostat (field installed)**

An electronic communicating LCD thermostat shall be provided. The thermostat shall offer three stages of heating and two stages of cooling with precise temperature control and have a four-wire connection to the unit. The thermostat shall be capable of manual or automatic change-over operation and shall operate in standard or programmable mode. An integrated humidity control feature shall be included to control a humidifier and/or a dehumidifier. The thermostat shall include a utility demand reduction feature to be initiated by an independent time program or an external input.

The thermostat shall have a comprehensive installation setup menu to include configuration of the unit CFM for each mode of operation and configuration of the water flow rate through the unit, including variation of the water flow rate based on the stage of unit operation.

The thermostat shall display system faults with probable cause and troubleshooting guidance. Comprehensive service diagnostics menus shall display, system inputs, system outputs, configuration settings, Geo source inlet and outlet temperatures, compressor discharge line temperature, liquid line temperature, leaving air temperature, and entering potable water temperature (on units equipped with a Hot Water Generator). The thermostat shall allow for immediate manual control of all DXM2 outputs at the thermostat for rapid troubleshooting.

### **Auxiliary Heater (field installed)**

An external, field-installed electric heater shall provide supplemental and/or emergency heating capability when used with the three stage heating thermostat.

## Warranty Information

The 2010 standard warranty applies to units ordered on or after May 1, 2010. See Comfort-Aire/Century's 2010 Limited Express Residential Warranty Certificate RP851 for specific coverage and limitation.

MARS Comfort-Aire/Century residential class heat pumps are backed by a 12-year limited warranty on all unit parts, including the following accessories when installed with Comfort-Aire/Century units: Flow Controllers, Thermostats & Electric Heaters.

MARS Comfort-Aire/Century goes even further to back up its commitment to quality by including a service labor allowance for the first five years on unit parts and thermostats, auxiliary electric heaters and geothermal pumping modules with completed Start Up Form.

Due to ongoing product improvements, specifications and dimensions are subject to change and correction without notice or incurring obligations. Determining application and suitability for use of any product is the responsibility of the installer. Additionally, the installer is responsible for verifying dimensional data on the actual product prior to beginning any installation preparations.

Incentive and rebate programs have precise requirements as to product performance and certification. All products meet applicable regulations in effect on date of manufacture; however, certifications are not necessarily granted for the life of a product. Therefore, it is the responsibility of the applicant to determine whether a specific model qualifies for these incentive/rebate programs.
